If organic tissues are preserved and not rapidly recycled Sink for CO2 Potential Hydrocarbons, Oil and Gas

https://d32ogoqmya1dw8.cloudfront.net/images/eslabs/carbon/photosynthesis\_456.png

Organisms living in the water die and leave behind their remains.

> Some layers cut off others from further decomposition and over millions of years, the partially decomposed organic matter is transformed into petroleum products.

Over long periods of time, inorganic and organic sediments accumulate.

If favourable movements of the crust compress layers and cause folding, domes can form that allow the less dense petroleum products to rise and accumulate. The black coloured zones represent crude oil deposits and the yellow zones represent pockets of natural gas.

Coral bleaching events are driven primarily by high sea surface temperatures. The oceans around northeast Australia have warmed nearly 1.5 degrees C (2.7 degrees F) since 1900, as shown in the figure above, and about 0.7 degrees C (1.2 degrees F) since 1979. https://www.theguardian.com/environment/2016/jun/07/the-great-barrier-reef-acatastrophe-laid-bare

## Reef on the brink The Great Barrier Reef: a catastrophe laid bare

Australia's natural wonder is in mortal danger. Bleaching caused by climate change has killed almost a quarter of its coral this year and many scientists believe it could be too late for the rest. Using exclusive photographs and new data, a Guardian special report investigates how the reef has been devastated – and what can be done to save it

by Michael Slezak

# High Temperature > 29 deg. C Coral Reefs are bleaching

http://news.medill.northwestern.edu/chicago/wp-content/uploads/sites/3/2016/03/American-Samoa-Before-During-After2.jpgcatastrophe

https://www.the guardian.com/en vironment/2016/ jun/07/thegreat-barrierreef-acatastrophe-laidbare Australia's Great Barrier Reef was particularly hard hit by the 2016 bleaching event and now by the unexpected 2017 bleaching event, with the areas with severe bleaching shown in the figure below:

**Figure from the ARC Centre of Excellence for Coral Reef Studies.** https://www.yaleclimateconnections.org/wp-content/uploads/2017/04/0417\_ZH\_Figure\_8.jpg

# High Atmospheric CO<sub>2</sub> Acidification of Upper Part of the Oceans

http://serc.carleton.edu/integrate/workshops/webinars/2016\_2017/climate\_ocean/index.html

Values of pH in surface seawater have shown a clear long-term trend of decrease from 3°N and 34°N along the repeat hydrographic line at 137°E in winter (Jan. - Feb.) since 1984. The rate of decrease is approximately 0.02 per decade at each latitude.

## Ocean acidification slowing coral reef growth

Geochimica et Cosmochimica Acta 144 (2014) 72–81

### Community calcification in Lizard Island, Great Barrier Reef: A 33 year perspective

J. Silverman a, ft, K. Schneider a, D.I. Kline b, c, T. Rivlin d, e, A. Rivlin d, S. Hamylton f, B. Lazar e, J. Erez e, K. Caldeira a

Measurements of community calcification (G<sub>net</sub>) were made during September 2008 and October 2009 on a reef flat in Lizard Island, Great Barrier Reef, Australia, 33 years after the first measurements were made there by the LIMER expedition in 1975.

In 2008 and 2009, we measured  $G_{net} = 61 \pm 12$  and 54 ± 13 mmol CaCO<sub>3</sub> m<sup>-2</sup>·day<sup>-1</sup>, respectively.

These rates are 27–49% lower than those measured during the same season in 1975–76.

Cassini captured this extraordinary photo on April 12 at a distance of 1,400 million km from Earth. Image Credit: **NASA**/JPL
