Integrating Tests of Autonomy with SW and People: Autonomy Requirements Tester (ART)

AIAA-HSI ATS 2017

Carroll Thronesbery, Ayman Qaddumi, Michael Merta, Eugene McMahon, Mike Monahan

Background: core Flight System (cFS)

- Autonomy Requirements Tester (ART) is design to be compatible with core Flight System (cFS)
- cFS architecture and software
 - Software platform developed by Goddard Space Flight Center (GSFC)
 - Reusable software framework across multiple projects
 - Set of reusable software applications
 - Dynamic run-time environment (real-time constraints)
 - Layered software
 - Component based design
 - Publish-subscribe message communication to make component apps independent
- ART can easily be modified to fit any pub-sub architecture

Autonomy Requirements Tester (ART): Human Centered View

- A tool to support software developers
 - Especially flight software
- People Tasks:
 - Capture autonomy requirements
 - Generate test specifications
 - Execute the test specs
 - Report results
 - Iterate for test-driven development

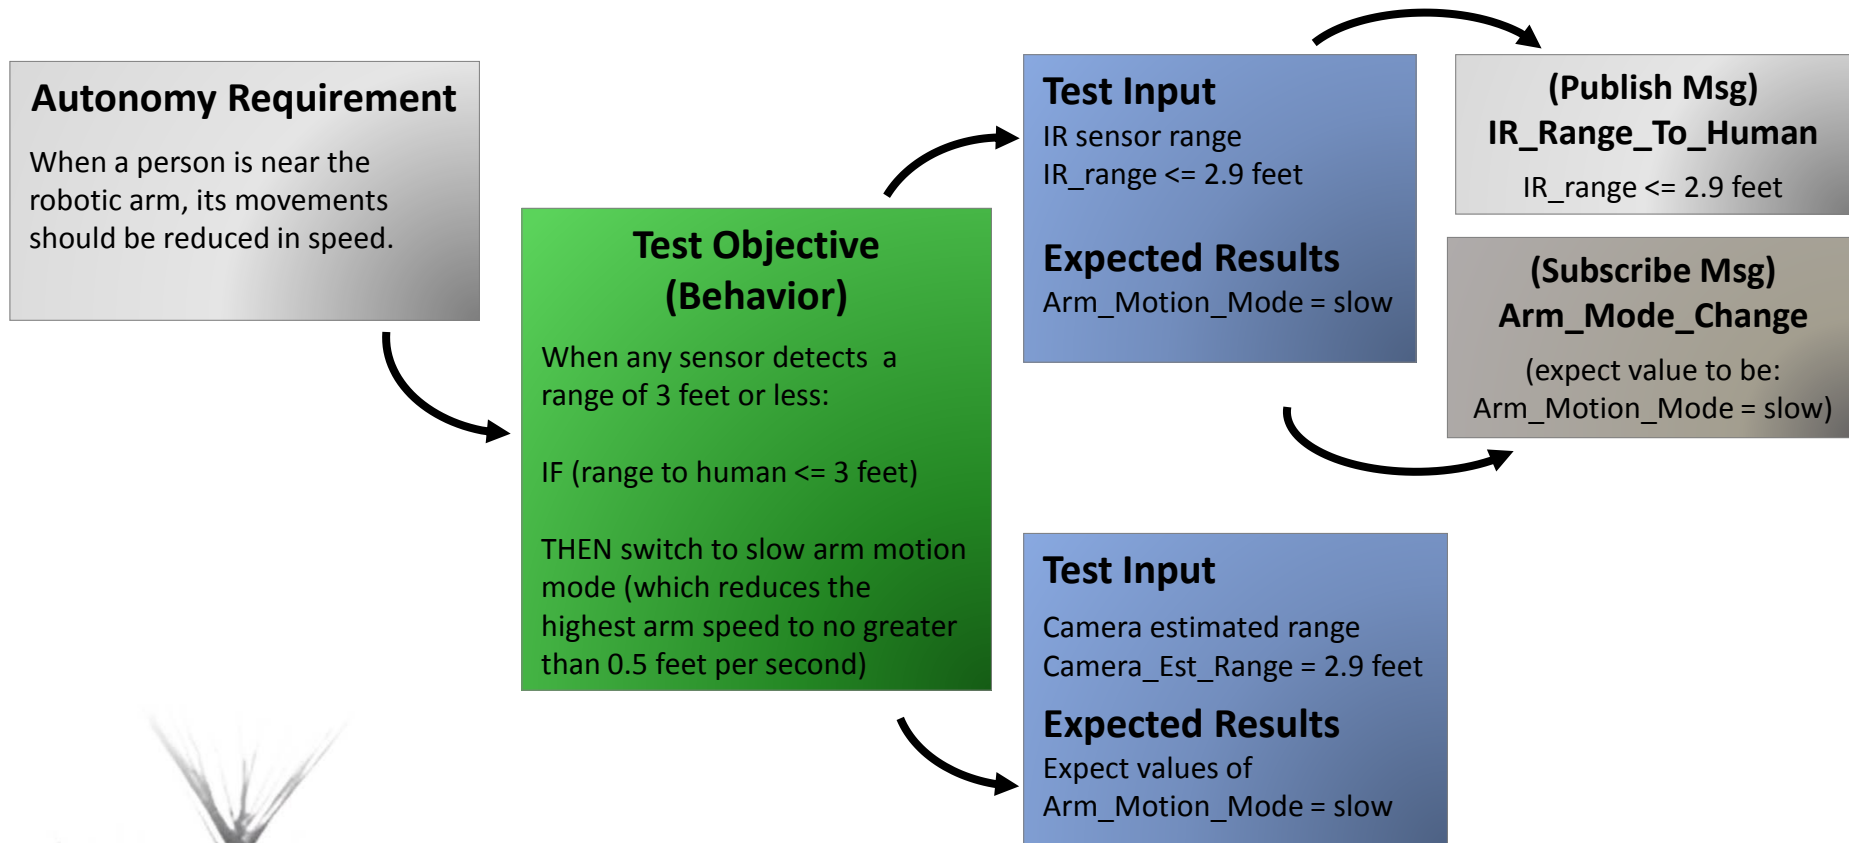

cFS-based Autonomy Requirements Tester (ART) project: System View

NASA Phase I SBIR sponsored by ARC & JSC

- Design eXtensible Markup Language (XML) schema to define cFS data models to support app-level testing
- Describe potential approaches for semi-autonomous test generation
- Design displays that support the management of requirements, test designs, and test results
- Develop a Concept of Operations (ConOps) with scenarios illustrating how ART supports people tasks
- Develop and demonstrate feasibility prototype

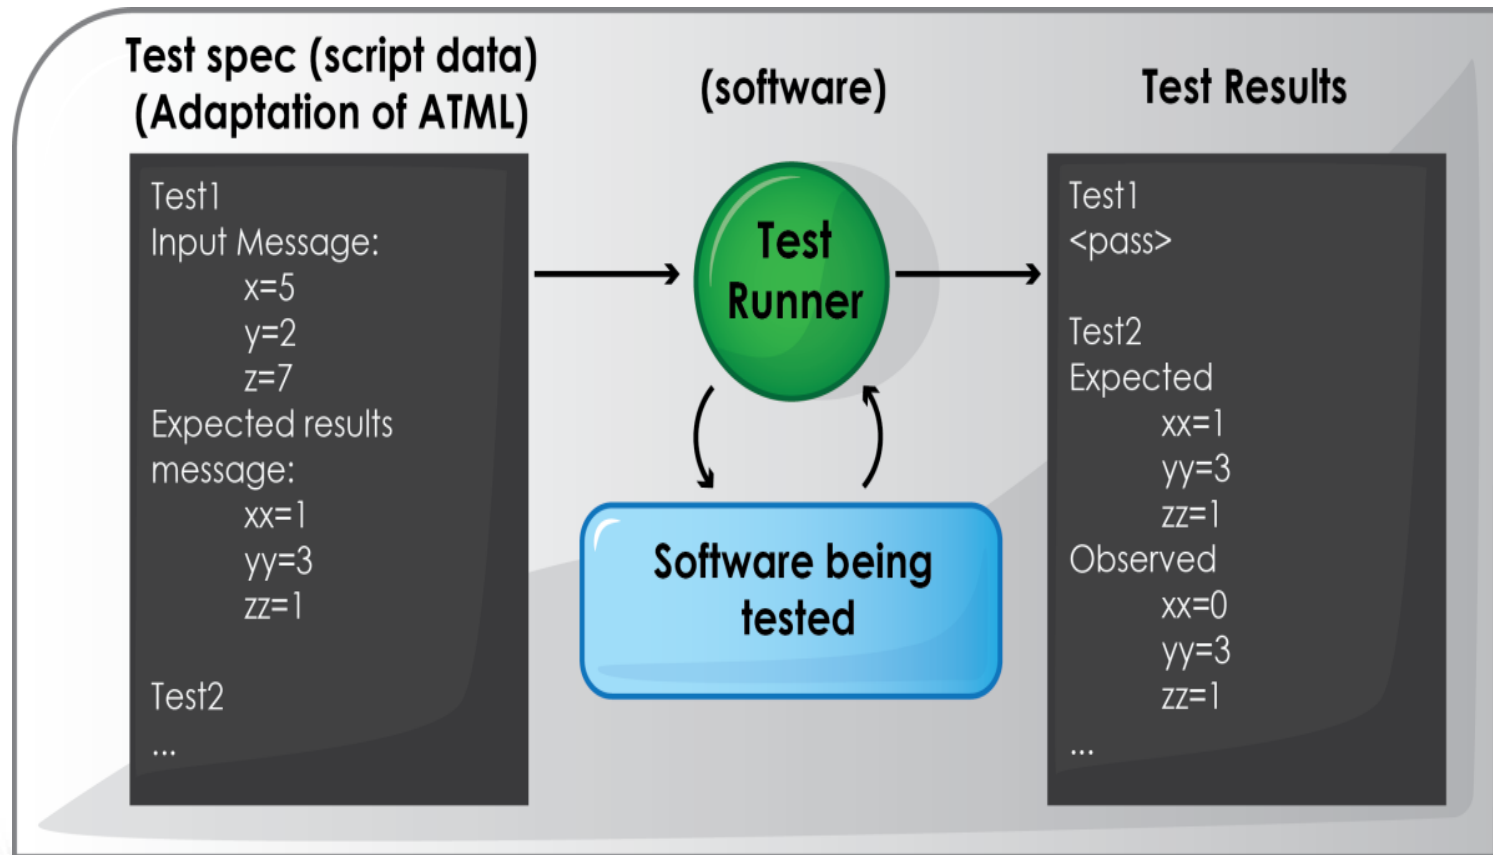

Represent Data for Progression from Requirement to Test Results

Test Runner Uses CFS Pub/Sub Architecture

Test Runner Reads Test Spec, Produces Test Results

Data Model Based on IEEE Standards

adopted by the Institute of Electrical and Electronics Engineers (IEEE) as a standard (IEEE Std 1671-2010)

The image displays three overlapping windows from the NI TestStand software interface:

- NI TestStand - Sequence Editor [Edit]:** Shows a sequence diagram for 'ComputerMotherboard'. The 'MainSequence' contains a 'Setup' group with 'SimulationDialog' and 'End Group', followed by a 'Main' group with 'Powerup Test', 'RAM Test', 'RAMDiagnostics', 'Video Test', 'VideoDiagnostics', 'PowerupDiagnostics', and 'End Group', and finally a 'Cleanup' group.
- XML Data View:** Displays an XML snippet representing test results, including fields like 'TestResults xmlns="http://www.ni.com/teststand/1.0"', 'UUT ID', 'ResultSet ID', 'endDateTime', and 'TestGroup name'.
- TestStand - Sequence Editor [Edit] - Report:** Shows an 'ATML Test Report' for 'Single Pass - Computer Motherboard ...'. The report includes:
 - TEST STATION:** SDELGADO
 - OPERATOR:** administrator
 - RESULT SET (191):** C:\Program Files\National Instruments\TestStand 4.0\Examples\Demo\LabVIEW\Computer Motherboard Test\Computer Motherboard Test Sequence_Report[NO_UUT_SERIAL_NUM0][1 54 48 PM][4 5 2007].XML
 - Date and Time Period:** 2007-04-05T13:54:48 through 2007-04-05T13:54:50
 - Outcome:** Passed
 - TestGroup (191):** C:\Program Files\National Instruments\TestStand 4.0\Examples\Demo\LabVIEW\Computer Motherboard Test\Computer Motherboard Test Sequence.seq#MainSequence
 - Outcome:** Passed
 - Simulation Dialog Test (192):** Date and Time Period: 2007-04-05T13:54:48 through 2007-04-05T13:54:50, Outcome: Done
 - Turn Vacuum Table On Test (193):** Date and Time Period: 2007-04-05T13:54:50 through 2007-04-05T13:54:50, Outcome: Done
 - Powerup Test Test (194):** Date and Time Period: 2007-04-05T13:54:50 through 2007-04-05T13:54:50, Outcome: Passed
 - If Test (195):** Date and Time Period: 2007-04-05T13:54:50 through 2007-04-05T13:54:50, Outcome: Done

Generating the Test Plan from Requirements

Observation from Phase I exercise with APL Solar Probe Plus type autonomy requirements

- Similarities from one requirement to the next
 - Often a tiered response, when first tier doesn't correct the issue, go to the next tier
 - Rule based behavior: If {condition} then {response}
- Similarities enable the formation of a template (illustrated on next page) for generating the test
- Some additional parameters are needed in addition to the template (illustrated on the page after that)

Generating Detailed Test Plans

- Detailed test plan can become tedious to specific in every detail
- Templates for a given set of requirements can remove some of the tedium
- Can encourage test-driven development

Parameter Entry to Enable Test Generation from Template

Enter Design Values To Construct Initial Test

AUT-3 Monitor Battery Temperature

Autonomy shall perform the following tiered response if the battery temperature is above a pre-defined limit:

- A) Soft-reset the PSC
- B) Power-cycle the PSC
- C) Switch the PSC (via a CIM side switch)

Enter values from design file ...

M N Persistence (m of n)

Max fire count

Priority

Initial rule state (enabled/disabled)

Battery temperature variable name (default from rqts xml)

pre-defined limit

Soft-reset the PSC command name (default from rqts xml)

Power-cycle the PSC command name (default from rqts xml)

Switch CIM side command name (default from rqts xml)

Template Contents for Generating Details of Test Specification

AUT-3	Monitor Battery Temperature	Autonomy shall perform the following tiered response if the battery temperature is above a pre-defined limit: A) Soft-reset the PSC B) Power-cycle the PSC C) Switch the PSC (via a CIM side switch)
-------	-----------------------------	---

1. Set nominal spacecraft system state
2. Verify autonomy takes no action
3. Inject fault
4. Verify faulted state (optional, especially level 0)
5. Verify autonomy response
6. Repeat steps 3-5 through all possible iterations
7. For tiered rule:
 1. Inject fault corrected by 1st action
 2. Inject fault corrected by 2^d action
 3. Inject fault corrected by 3^d action
 4. Inject unrecovered fault

1st Part of Detailed Test Plan

Initialize

1. Set nominal spacecraft system state
 - set rule_fire_count(AUT3) to 0
 - set battery_temp = 159, every second
2. Verify autonomy takes no action
 - Wait 12 sec ($m \times 2$)
 - Verify rule_fire_count(AUT3)=0

Succeed on Tier 1 Response

1. Inject fault
 - set battery_temp = 161, every second
2. Verify tier 1 autonomy response
 1. Wait 7 sec ($n+1$)
 2. Verify PSC_reset_cmd
 3. Verify rule_fire_count(AUT3) = 1
3. Success
 1. set battery_temp = 159, every second
 2. Wait 15 sec ($m \times 3$)
 3. Expect rule_fire_count(AUT3) = 1
 4. Verify that there is no:
 1. PSC_reset_cmd
 2. PSC_pwr_reset_cmd
 3. change_CIM_side_cmd

Succeed on Tier 2 Response

Succeed on Tier 3 Response

Unrecovered Function

Initialize

Succeed on Tier 1 Response

Succeed on Tier 2 Response

1. Inject fault
 - set battery_temp = 161, every second
2. Verify tier 2 autonomy response
 1. Wait 7 sec ($n+1$)
 2. Verify PSC_pwr_reset_cmd
 3. Verify rule_fire_count(AUT3) = 2
3. Success
 1. set battery_temp = 159, every second
 2. Wait 15 sec ($m \times 3$)
 3. Expect rule_fire_count(AUT3) = 2
 4. Verify that there is no:
 1. PSC_reset_cmd
 2. PSC_pwr_reset
 3. change_CIM_side

Succeed on Tier 3 Response

Unrecovered Function

Autonomous Rule System Requirements Overview				
Requirements	Test Plans	Test Results	Requirement AUT-3 Monitor Battery Temp	
Requirement ID	Title		ID	AUT-3
AUT-1	Detect Loss of Telemetry		Name	Monitor Battery Temp
AUT-2	Detect Invalid Telemetry		Categories	Device Health, Thermal Monitoring
AUT-3	Monitor Battery Temp		Parents	SC-1
AUT-4	Monitor Battery State of Charge		Rationale	Protects against a potential PSC control fault that could cause excessive battery temperature.
AUT-5	Detect Critically Low State of Charge		Details	
AUT-6	Battery Heater Power On		Text	Autonomy shall perform the following tiered response if the battery temperature is above a pre-defined limit: A) Soft-Reset the PSC, B) Power-cycle the PSC, C) Switch the PSC (via a CIM side switch).
AUT-7	Battery Heater Power Off		Condition	Battery_temp > 160
			Subject	Autonomous system
			Tiered Action(s)	Soft-reset the PSC, Power-cycle the PSC, Switch the PSC (via a CIM side switch)
			Object	PSC
			Limit Value	160
			Constraint	N/A

```

ART Emphases

- Focus of Phase I (completed)

- Hard, real-time autonomy (low level of autonomy) and cFS
- Test-driven development
- Unit test for app in publish-subscribe architecture

- Advantages of this approach

- Start test driven development early
- Ease the expression of autonomy requirements in terms of expected behavior
- Support pre-integration testing – unit testing and regression testing
- Make integration testing time more productive – no logic errors in software
- During integration, if software changes are required
 - If software changes are required
 - Make the changes
 - Re-run the pre-integration test to ensure no errors were inadvertently entered
 - Resuming integration testing

Innovations

- Represent requirements and link with intended behaviors for testing the requirements
- Formal data models for requirements, behavioral expectations, test specifications, and test results
- Use of template to drive the elaboration of test specifications
- Support for test driven development
- Integration of the testing mechanism with the operational environment to support (CFS users)
 - Enabled by modular architecture w/ pub-sub communications scheme
 - No change to the unit under test between testing and operations
 - Paves the way for runtime checkout routines for selected apps (e.g., sensors for deep-space science operations)
- Reporting of test results – similar appearance to specifications, still linked to requirements

Next Steps

- Identification of how to support higher levels of integration testing:
- Identification of how to support additional types of autonomy requirements:
- Identification of additional options for semi-autonomous test generation:
- Proof-of-principle prototype of ART
- Evaluation of proof-of-principle prototype
